## Revision History

Date	Revision	Changes
2014-05-28	0	first version
2015-03-30	1	BasicLine in big plastic housing and aluminium housing added
2016-03-07	2	EMC data BasicLine added
2017-01-25	3	MTTF values and digital filter default values added
2017-02-09	4	BasicLine in small plastic housing with cable connection added Assembly drawings adjusted
2017-10-25	5	pin designation M12- plug and female connector + M8 plug connector
2018-05-22	6	Updating CE conformity

### Note:

To use the inclination sensor, and for proper understanding of this manual, general knowledge of the field bus systems CAN and CANopen is required.

## Table of Contents

1 Overview.....	1
1.1 Characteristics.....	1
1.2 Applications.....	1
2 Technical Data IS1TK360-O-RL + IS2TK090-O-RL.....	2
3 Technical Data IS1BP360-O-CL + IS2BP090-O-CL.....	5
4 Technical Data IS1MA360-O-BL + IS2MA090-O-BL.....	9
5 Technical Data IS1BP360-O-BL + IS2BP090-O-BL.....	12
6 Technical Data IS1SP360-O-BL, IS2SP090-O-BL, IS1SP360-C-BL-10 + IS2SP090-O-BL-10.....	15
7 Mounting.....	20
7.1 Position of Drilling Holes.....	20
8 Connection.....	23
8.1 Connector Pin Out.....	23
8.2 Bus-Termination Resistor.....	23
9 Function Description.....	24
9.1 Overview of Function.....	24
10 CANopen Interface.....	25
10.1 CANopen Structure.....	25
10.2 CANopen Device Model.....	25
10.3 COB-IDs.....	25
10.4 Network Management: NMT.....	26
10.5 Process Data: PDO (TPDO1).....	26
10.5.1 PDO Communication Types.....	27
10.5.1.1 Individual Request (Polling).....	27
10.5.1.2 Cyclic Transmission.....	27
10.5.1.3 Synchronous Transmission.....	27
10.5.1.4 Event-controlled transmission on inclination change (manufacturer specific).....	27
10.6 Service Data: SDO.....	28
10.7 Object Dictionary.....	28
10.7.1 Communication Parameters (according to CiA DS-301).....	29
10.7.1.1 Error Register (1001h).....	30
10.7.1.2 Manufacturer Status Register (1002h).....	30
10.7.1.3 Pre-defined Error Field (1003h).....	31
10.7.1.4 Saving (1010h) and Loading (1011h) of Parameters.....	31
10.7.1.5 Transmit PDO1 – Transmission Type (1800h ).....	32
10.7.2 Manufacturer Specific Part.....	32
10.7.2.1 Automatic Bus-Off Recovery (2002h).....	32
10.7.2.2 Digital Filter Settings (3000h).....	32
10.7.2.3 TPDO1 Transmission on Inclination Change (3001h).....	33
10.7.3 Device Profile Specific Part (according to CiA DS-410).....	34
10.7.3.1 Resolution (6000h).....	34
10.7.3.2 Inclination values longitudinal and lateral (6010h and 6020h).....	34

10.7.3.3 Operating Parameters (6011h and 6021h).....	34
10.7.3.4 Zero Point Adjustment: Preset Value, Offset Value, Differential Offset Value (60x1/2/3h)....	35
10.8 Emergency Objects.....	36
10.9 Failure monitoring.....	37
10.9.1 Nodeguarding / Lifeguarding.....	37
10.9.2 Heartbeat.....	37
10.10 LSS: Layer Setting Service (according to CiA DSP-305).....	38
10.10.1 Setting of Node-ID and Baud Rate.....	38
10.11 Automatic Baud Rate Detection (according to CiA AN-801).....	38
10.12 Active compensation of thermal accuracy shift.....	39
10.13 Status LED (according to CiA DR-303-3).....	39
11 Sensor configuration.....	40
11.1 Inclination sensor programming adapter.....	40
11.2 PC software ISDControl.....	41
12 Ordering Information.....	42

## Term and Abbreviation Definition

<b>Baud rate</b>	Speed of data transfer (1 Baud = 1 Bit/s)
<b>BOOL</b>	Data type BOOLEAN (8 Bit, 0 = FALSE, 1 = TRUE)
<b>CAN</b>	Controller Area Network
<b>CANopen</b>	Standardized application layer for CAN devices
<b>CiA</b>	CAN in Automation e.V.
<b>CiA DS</b>	CiA Draft Standard (specification published by CiA)
<b>CiA DS-301</b>	Specification of the CANopen application layer and the communication parameters in the OD
<b>CiA DP</b>	CiA Device Profile (device profile published by CiA)
<b>CiA DR</b>	CiA Draft Recommendation (recommended implementation published by CiA)
<b>CiA DR-303-3</b>	Recommended implementation for display of CANopen-device states and errors by LED(s)
<b>CiA DSP</b>	Draft Standard Proposal (specification draft published by CiA)
<b>CiA DSP-410</b>	Specification draft of the device profile 410 for inclination sensors
<b>Client</b>	CANopen station which claims the service of a server
<b>COB</b>	CANopen Communication Object
<b>COB-ID</b>	CAN-Identifier of a COB
<b>DOMAIN</b>	Data type DOMAIN (arbitrary large block of data, e.g. program code)
<b>EDS</b>	Electronic Data Sheet (of a CANopen device)
<b>EMCY</b>	Emergency Object (Object that informs of errors)
<b>xxxxh/xxh</b>	Index/Subindex, position of an OD parameter
<b>Heartbeat</b>	Surveillance mechanism for CANopen stations
<b>ID</b>	Identifier of a CAN message
<b>INT8</b>	Data type INTEGER8 (8 Bit, complement on two, -128...127)
<b>INT16</b>	Data type INTEGER16 (16 Bit, two's complement, -32768...32767)
<b>longitudinal/ lateral</b>	Axis assignment (X/Y-axis)
<b>LSS</b>	Layer Setting Service
<b>NMT</b>	Network Management Object (Object to set and check CANopen device states)
<b>Node-ID</b>	Node number of a CANopen device (1...127)
<b>Node- / Lifeguarding</b>	Surveillance mechanism for CANopen stations
<b>Operational</b>	CANopen device state (SDO, PDO, EMCY, NMT possible)
<b>OD</b>	Object dictionary (virtual directory with device parameters, addressed by index and subindex)
<b>PDO</b>	Process Data Object (Object for transfer of process data without protocol offset)
<b>PDO Mapping</b>	Sequence in which process data is arranged in a PDO
<b>Pre-Operational</b>	CANopen device state (SDO, EMCY, NMT possible)
<b>Pre-defined Connection Set</b>	In CiA DS-301 defined concept how COB IDs of the communication objects have to be calculated in dependence of the Node ID
<b>ro</b>	Read only, access right „read only“ of an object in the object dictionary
<b>RTR</b>	Remote Transmit Request, Bit which causes the receiver to send data
<b>rw</b>	Write and read, access right „write and read“ of an object in the object dictionary
<b>SDO</b>	Service Data Object (object for access to the object dictionary)
<b>Server</b>	CANopen station which offers a service for one/several client(s)
<b>Stopped</b>	CANopen device state (only NMT possible)
<b>UNS8</b>	Data type UNSIGNED8 (8 Bit, without sign, 0...255)
<b>UNS16</b>	Data type UNSIGNED16 (16 Bit, without sign, 0...65535)
<b>UNS32</b>	Data type UNSIGNED32 (32 Bit, without sign, 0...4294967296)
<b>VSTR</b>	Data type VISIBLE STRING (ASCII-string inclusive end identifier 0h)
<b>wo</b>	write only, access right „write only“ of an object in the object dictionary

# 1 Overview

## 1.1 Characteristics

- 1-dimensional inclination sensors with measurement range: 360° ( $\pm 180^\circ$ )
- 2-dimensional inclination sensors with measurement range:  $\pm 90^\circ$  (X/Y)
- High sampling rate and bandwidth
- High resolution (0.01°)
- High accuracy (0,05° IS2TK090-O-RL + IS2BP090-O-CL and 0,15° IS2xx090-O-BL(-10) )
- Compensated temperature coefficient for ISxTKxxx-O-RL  
(10x improved temperature coefficient to ISxBPxxx-O-CL)
- Compensated cross sensitivity
- Programmable vibration suppression
- Comfortable CANopen interface
  - Meets the CiA DS-301, device profile CiA DSP-410
  - Baud rates from 10 kBit/s to 1 MBit/s
  - Automatic baud rate detection
  - Setting Node ID and baud rate via LSS service
- Functions:
  - One TPDO dynamically mappable (RTR, cyclic, event-controlled, synchronized)
  - SYNC Consumer (synchronized transmission of the TPDO after receiving a SYNC message)
  - EMCY Producer
  - Failure monitoring via Heartbeat or Nodeguarding / Lifeguarding
- Metal housing with stainless steel base plate or UV resistant, impact strength plastic housing
- Suitable for industrial use:
  - Temperature range plastic housing: -40 °C to +80 °C
  - Degree of protection: IP65/67

The inclination sensors IS1xx360-O-xL(-10) are suitable to measure the inclination in the measurement range of 360°. The 2-dimensional inclination sensors IS2xx090-O-xL(-10) are suitable to measure the inclination in 2 dimensions (X/Y) in the measurement range of 90°. To ensure a high accuracy, the sensors are calibrated at the factory.

The compact and robust design makes the sensors a suitable angle measurement device in rough surroundings for different applications in industry and automotive technology. A simple setting of all parameters, which are stored in the internal permanent memory, is possible via CAN bus interface.

## 1.2 Applications

- Solar thermal and photo-voltaic systems
- Agricultural and forestry machinery
- Construction machinery
- Crane and hoisting technology

## 2 Technical Data IS1TK360-O-RL + IS2TK090-O-RL

General Parameters <sup>1</sup>	IS1TK360-O-RL			IS2TK090-O-RL		
Measurement range	360°			±90°		
Resolution	0.01°			0.01°		
Accuracy	Range 0...360°	typical ±0.04°	maximum ±0.10°	Range up to ±60° up to ±70° up to ±80° up to ±85°	typical ±0.02° ±0.04° ±0.08° ±0.16°	maximum ±0.05° ±0.10° ±0.20° ±0.40°
Cross Sensitivity (compensated)	-			typ. ±0.09° (±0.10 %FS) max. ±0.45° (±0.50 %FS)		
Temperature coefficient (zero point)	typ. ±0.0008 °/K (typ. < ±0.10° over range -40 °C ... +80 °C)					
Sampling rate	80 Hz					
Cut-off frequency	typ. 20 Hz, 2 <sup>nd</sup> order (without digital filter) / 0.1 ... 25 Hz, 8 <sup>th</sup> order (with digital filter) Default digital filter: critically damped filter 8 <sup>th</sup> order at 2 Hz					
Operating temperature	-40 °C to +80 °C					
Characteristics						
Data rates	10 k, 20 k, 50 k, 62.5 k, 100 k, 125 k, 250 k, 500 k, 800 k Bit/s, 1 Mbit/s, autom. detection					
Functions	Angle request, cyclical and synchronized outputs, Digital filter (critically damped (default) or Butterworth lowpass, 8 <sup>th</sup> order), configuration via object dictionary					
Electrical Parameters						
Supply voltage	8 to 48 VDC					
Current consumption	<200 mA @ 24 V (P <sub>Peak</sub> ≤4.8 W)					
Mechanical Parameters						
Connector CAN	2x sensor connector 5-pole M12 (male + female, loop through connection)					
Degree of protection	IP65/67					
Dimensions / Weight	Metal housing: 82 mm x 82 mm x 25 mm / ca. 310 g					
Reliability according EN ISO 13849-1 <sup>2</sup>						
MTTF	194 years					
MTTFd	365 years					

**Table 1: Technical Data IS1TK360-O-RL + IS2TK090-O-RL**

1 All indicated angle accuracies are valid after a running time of 10 minutes at 25 °C, Cut-off frequency 0.3 Hz  
Absolute calibration accuracy (at 25 °C): ±0.05°

2 This product is a standard product and no safety part in accordance with the machinery directive. The calculation is based on an average environment temperature of 40 °C and a usage of 8760 h/a.

**CANopen conformity, Certificate# CiA201108-301V402/20-0143**

CiA DS-301, v4.2.0	Application layer and communication profile
CiA DS-410	Device profile for inclinometer
CiA DSP-305	Layer setting service (LSS) and protocols
CiA DR-303-3	Indicator specification (Status-LED)
CiA AN-801	Automatic bit-rate detection

**CE conformity**
**EC Directives**

2014/30/EU	EMC directive
2011/65/EU	RoHS directive

**Harmonized standards**

DIN EN 13309:2010-12	Construction machinery - Electromagnetic compatibility of machines with internal power supply
DIN EN 50581:2013-02	Technical documentation for the assessment of electrical and electronic products with respect to the restriction of hazardous substances

**Table 2: CE and CANopen conformity IS1TK360-O-RL + IS2TK090-O-RL**

### Electromagnetic Compatibility (EMC)

#### Transient Emissions

Radiated disturbance / Radio field strength	Limit curves broadband and narrowband DIN EN ISO 14982 (agricultural and forestry machinery) respectively DIN EN 13309 (construction machinery) 30 ... 1000 MHz (vertical and horizontal)
---	--

#### Immunity to Radio Frequency Fields (RF fields)

Strip line according to ISO 11452-5	Limits according to DIN EN ISO 14982 (agricultural and forestry machinery) respectively DIN EN 13309 (construction machinery) 20 ... 400 MHz 200 V/m (1 kHz AM) Performance criteria A
-------------------------------------	---

Anechoic chamber according to ISO 11452-2	Limits according to DIN EN ISO 14982 (agricultural and forestry machinery) respectively DIN EN 13309 (construction machinery) 200 ... 1000 MHz vertical, 100 V/m (1 kHz AM, 80 %) 800 ... 2000 MHz vertical, 100 V/m (PM, $t = 577 \mu\text{s}$ , period 4600 $\mu\text{s}$ ) Performance criteria A
---	---

#### Immunity to Conducted Disturbances

Test pulse according to ISO 7637-2 (on-board power supply 24 VDC)	Test pulse	Severity level	Performance criteria
	1 -450 V	III	C
	2a +37 V	III	B
	2b +20 V	III	B
	3a -150 V	III	A
	3b +150 V	III	A
	4 -12 V	III	A
	5a +70 V	$R_i = 10 \Omega$	A
	5b +36 V	$R_i = 0.5 \Omega$	A

#### Immunity to Electromagnetic Discharge (ESD)

ESD according to ISO 10605	Limits according to DIN EN ISO 14982 (agricultural and forestry machinery) respectively DIN EN 13309 (construction machinery) discharge combination 330 pF / 330 $\Omega$ Contact discharge 8 kV bipolar (metallic parts) Air discharge 15 kV bipolar Performance criteria A
----------------------------	--

**Table 3: Electromagnetic Compatibility (EMC) IS1TK360-O-RL + IS2TK090-O-RL**

**Figure 1: Measurement axes orientation IS1TK360-O-RL + IS2TK090-O-RL metal housing (factory default settings)**

### 3 Technical Data IS1BP360-O-CL + IS2BP090-O-CL

General Parameters <sup>3</sup>	IS1BP360-O-CL			IS2BP090-O-CL		
Measurement range	360°			±90°		
Resolution	0.01°			0.01°		
Accuracy	Range 0...360°	typical ±0.04°	maximum ±0.10°	Range up to ±60° up to ±70° up to ±80° up to ±85°	typical ±0.02° ±0.04° ±0.08° ±0.16°	maximum ±0.05° ±0.10° ±0.20° ±0.40°
Cross Sensitivity (compensated)	-			typ. ±0.09° (±0.10 %FS) max. ±0.45° (±0.50 %FS)		
Temperature coefficient (zero point)	typ. ±0.008 °/K					
Sampling rate	80 Hz					
Cut-off frequency	typ. 20 Hz, 2 <sup>nd</sup> order (without digital filter) / 0.1 ... 25 Hz, 8 <sup>th</sup> order (with digital filter) Default digital filter: critically damped filter 8 <sup>th</sup> order at 2 Hz					
Operating temperature	-40 °C to +80 °C					
Characteristics						
Data rates	10 k, 20 k, 50 k, 62.5 k, 100 k, 125 k, 250 k, 500 k, 800 k Bit/s, 1 MBit/s autom detection					
Functions	Angle request, cyclical and synchronized outputs, Digital filter (critically damped (default) or Butterworth lowpass, 8 <sup>th</sup> order), configuration via object dictionary					
Electrical Parameters						
Supply voltage	8 to 48 VDC					
Current consumption	<33 mA @ 24 V					
Mechanical Parameters						
Connector CAN	2x sensor connector 5-pole M12 (male + female, loop through connection)					
Degree of protection	IP65/67					
Dimensions / Weight	Plastic housing: 66 mm x 90 mm x 36 mm / ca. 215 g					
Reliability according EN ISO 13849-1 <sup>4</sup>						
MTTF	438 years					
MTTFd	835 years					

**Table 4: Technical Data IS1BP360-O-CL + IS2BP090-O-CL**

<sup>3</sup> All indicated angle accuracies are valid after a running time of 10 minutes at 25 °C, Cut-off frequency 0.3 Hz  
Absolute calibration accuracy (at 25 °C): ±0.05°

<sup>4</sup> This product is a standard product and no safety part in accordance with the machinery directive. The calculation is based on an average environment temperature of 40 °C and a usage of 8760 h/a.

**CANopen conformity, Certificate# CiA201108-301V402/20-0143**

CiA DS-301, v4.2.0	Application layer and communication profile
CiA DS-410	Device profile for inclinometer
CiA DSP-305	Layer setting service (LSS) and protocols

## 4 Technical Data IS1MA360-O-BL + IS2MA090-O-BL

General Parameters <sup>5</sup>	IS1MA360-O-BL			IS2MA090-O-BL		
Measurement range	360°			±90°		
Resolution	0.01°			0.01°		
Accuracy	Range 0...360°	typical ±0.15°	maximum ±0.25°	Range up to ±60° up to ±80°	typical ±0.10° ±0.20°	maximum ±0.20° ±0.30°
Cross Sensitivity (compensated)	-			typ. ±0.09° (±0.10 %FS) max. ±0.45° (±0.50 %FS)		
Temperature coefficient (zero point)	typ. ±0.008 °/K					
Sampling rate	80 Hz					
Cut-off frequency	typ. 20 Hz, 2 <sup>nd</sup> order (without digital filter) / 0.1 ... 25 Hz, 8 <sup>th</sup> order (with digital filter) Default digital filter: critically damped filter 8 <sup>th</sup> order at 2 Hz					
Operating temperature	-40 °C to +80 °C					
<b>Characteristics</b>						
Data rates	10 k, 20 k, 50 k, 62.5 k, 100 k, 125 k, 250 k, 500 k, 800 k Bit/s, 1 MBit/s automatic detection					
Functions	Angle request, cyclical and synchronized outputs, Digital filter (critically damped (default) or Butterworth lowpass, 8 <sup>th</sup> order), configuration via object dictionary					
<b>Electrical Parameters</b>						
Supply voltage	8 to 48 VDC					
Current consumption	<16 mA @ 24 V					
<b>Mechanical Parameters</b>						
Connector CAN	1x sensor connector 5-pole M12 (male)					
Degree of protection	IP65/67					
Dimensions / Weight	Aluminium housing: 58 mm x 90 mm x 31 mm / about 200 g					
<b>Reliability according EN ISO 13849-1<sup>6</sup></b>						
MTTF	354 years					
MTTFd	664 years					

**Table 7: Technical Data IS1MA360-O-BL + IS2MA090-O-BL**

5 All indicated angle accuracies are valid after a running time of 10 minutes at 25 °C, Cut-off frequency 0.3 Hz  
Absolute calibration accuracy (at 25 °C): ±0.05°

6 This product is a standard product and no safety part in accordance with the machinery directive. The calculation is based on an average environment temperature of 40 °C and a usage of 8760 h/a.

## 8 Connection

### 8.1 Connector Pin Out

The inclination sensors ISxTKxxx-O-RL, ISxBPxxx-O-CL, ISxMAxxx-O-BL, ISxBPxxx-O-BL and ISxSPxxx-O-BL-10 are equipped with a common 5-pole round plug M12 (A-coded). The types ISxTKxxx-O-RL, ISxBPxxx-O-CL and ISxBPxxx-O-BL are additionally equipped with a 5-pole round female connector (A-coded). The pin allocation fulfills CiA DR-303-1 (Figure 13 + Figure 14).

Pin	Signal	Allocation
1	CAN_SHLD	Shield
2	V+	Supply voltage (+24 V)
3	V-	GND / 0 V / V-
4	CAN_H	CAN_H bus line
5	CAN_L	CAN_L bus line

### 8.2 Bus-Termination Resistor

The inclination sensors do **not** contain an internal termination resistor.

## 9 Function Description

### 9.1 Overview of Function

The inclination sensors IS1xx360-O-xL(-10) and IS2xx090-O-xL(-10) contain a standardized CANopen interface according to CiA DS-301 and a device profile according to CiA DSP-410. All measured values and parameters are accessible through the object dictionary (OD). The individual configuration can be saved in the internal permanent memory (EEPROM). The following CANopen functions are available:

- One transmission data object (TPDO1) dynamically mappable in four possible operating modes:
  - Individual request via remote transmit request message frame (RTR)
  - Cyclic transmission at defined intervals
  - Event-controlled transmission on inclination change
  - Synchronous transmission after receiving a SYNC message frame
- One Service Data Object (Default SDO)
- Error messages by Emergency Object (EMCY) with support of the
  - General Error Register
  - Manufacturer specific status register (Manufacturer Status)
  - List of errors (Pre-defined Error Field)
- Heartbeat and Nodeguarding / Lifeguarding monitoring mechanisms
- Store and load function of all parameters (Store and Load Parameter Field)
- Condition and error information by two-colored LED (according to CiA DR-303-3)

Further manufacturer and profile specific characteristics exist in addition to the CiA DS-301 functionality:

- Configurable cut-off frequency (digital filter)
- Configuration of the minimum angle change for TPDO1 transmit event
- Direction switch of the inclination value
- Configurable zero point of the inclination value
- Setting of the Node-ID as well as the baud rate via LSS service according to CiA DSP-305
- Automatic baud rate detection according to CiA AN-801

## 10 CANopen Interface

### 10.1 CANopen Structure

CANopen is a CAN-based open protocol standard in automation and was standardized in association with “CAN in Automation” (CiA). Like virtually all field buses CANopen is based also on the ISO/OSI 7-layer model. The protocol makes use of the CAN bus as a transmission medium and defines the elements for network management, the use of the CAN identifier (message address), the temporal behavior on the bus, the type of data transfer and application profiles. This is to ensure that CANopen devices from different manufacturers can be combined.

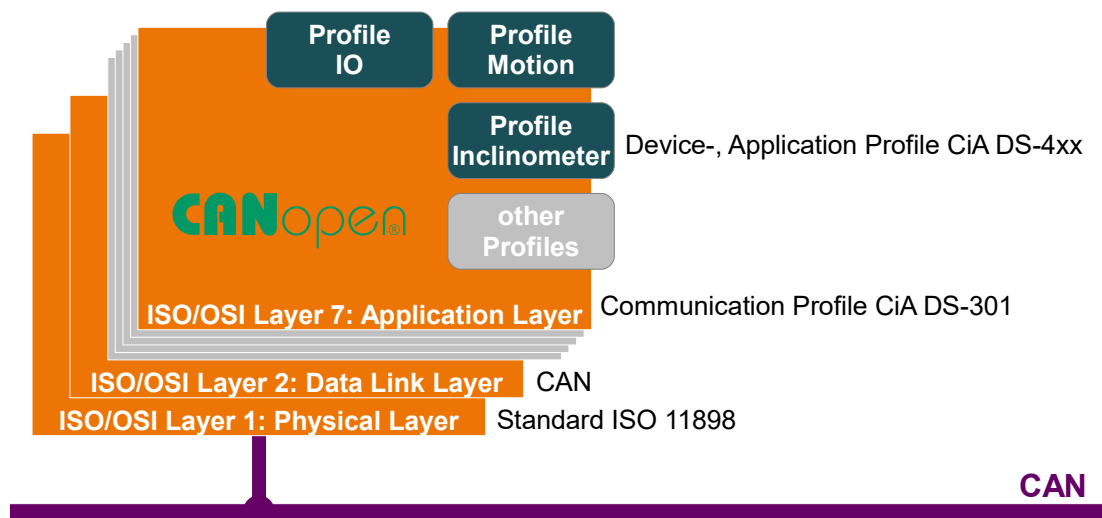

Figure 16: CANopen Structure

CANopen describes the ISO / OSI layer 7 (application layer) as a communication profile that was specified in the CiA standard CiA DS-301. The standard defines the method of communication for all devices consistently. In addition, more device and application profiles for specific classes of devices and applications in the CiA standard DS-4xx are defined.

### 10.2 CANopen Device Model

The exchange of data between CANopen devices is realized via data objects. The CANopen communication profile thus provides for the following types of objects. The process data objects (PDO) are high-priority messages used for the exchange of process data. Access to the object dictionary of a device is done via the service data objects (SDOs). Network management objects are used to control the state machine of the CANopen device and to monitor the nodes. Furthermore, there are special objects for error messages (Emergency), Synchronization (SYNC) and time stamp. Every CANopen device has a CANopen object dictionary, in which the parameters for all CANopen objects are registered.

### 10.3 COB-IDs

The CAN identifier of the communication objects is determined according to the Pre-defined connection set at each reset (communication, application and hardware reset), depending on the selected Node-ID. Table 16 shows the calculation base with the default values (Node-ID = 10).

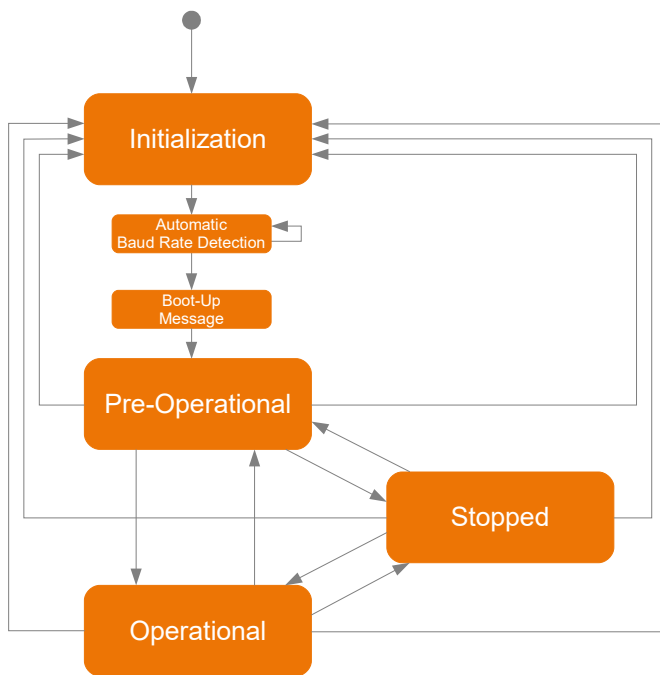

Communication object (COB)	Calculation of the COB-ID	Default value (Node-ID = 10)
NMT	0h	0h
SYNC	80h	80h
EMCY	80h + Node-ID	8Ah
TPDO1	180h + Node-ID	18Ah
Default SDO (Client > Server)	600h + Node-ID	60Ah
Default SDO (Server > Client)	580h + Node-ID	58Ah
Heartbeat	700h + Node-ID	70Ah

**Table 16: Calculation of the COB-IDs for Pre-defined Connection Set**

### 10.4 Network Management: NMT

Figure 17 shows the NMT state machine of a CANopen device. After **Initialization** the device automatically goes into the state **Pre-Operational**. The device sends a **Boot-Up Message**. In this state it can be configured via the object dictionary. The service data objects (SDO) are already active. The process data objects, however, are still locked.

**Figure 17: NMT State diagram**

By sending the CAN message "Start Remote Node" the unit will go into the state **Operational**. Now the process data objects are active. In **Stopped** state, no communication with the exception of Nodeguarding and Heartbeat is possible.

### 10.5 Process Data: PDO (TPDO1)

Each inclination sensor has exactly one transmit process data object (TPDO). The TPDO contains the current values of inclination (axial or longitudinal and lateral). The PDO mapping of the measured values is dynamically adjusted. The default mapping is shown in Table 17/18.

Data part of the CAN Frame of the TPDO1							
Byte0	Byte1	Byte2	Byte3	Byte4	Byte5	Byte6	Byte7
Inclination value axial (OV: 6010h)		unused					

**Table 17: TPDO1 Default mapping Type: IS1xx360-O-xL(-10)**

Data part of the CAN Frame of the TPDO1							
Byte0	Byte1	Byte2	Byte3	Byte4	Byte5	Byte6	Byte7
Inclination value longitudinal (X-Axis, OV: 6010h)		Inclination value lateral (Y-Axis, OV: 6020h)		unused			

**Table 18: TPDO1 Default mapping Type: IS2xx090-O-xL(-10)**

## 10.5.1 PDO Communication Types

### 10.5.1.1 Individual Request (Polling)

The TPDO1 can be requested at any time by transmitting a remote-transmit request message frame.

### 10.5.1.2 Cyclic Transmission

The cyclic transmission of the TPDO1 is activated if the entry 1800h/05h (interval time in milliseconds) contains a value greater than 0. Furthermore, the entry 1800h/02h (transmission type) must contain the value 254 (asynchronous, manufacturer-specific). In this case, the inclination sensor will transmit the TPDO1 cyclically at the set period interval when in the OPERATIONAL state.

### 10.5.1.3 Synchronous Transmission

The synchronous transmission is used to get inclination values from more than one sensor at the same time. Therefore CANopen provides a SYNC object - a CAN message without user data - transmitted with high priority on the bus. This SYNC object is transmitted from a bus node (usually the master) cyclically at fixed intervals. All inclination sensors read their current value after every  $n^{\text{th}}$  reception of the SYNC object and then transmit the TPDO1 directly as soon as the bus permits. For this the entry 1800h/02h (Transfer Type) must contain the value  $n = 1 \dots 240$ .

### 10.5.1.4 Event-controlled transmission on inclination change (manufacturer specific)

The bus load from PDOs can be reduced if the TPDO1 is only transmitted when an appropriate angle change has occurred. This function can only be configured in the manufacturer-specific part of the object directory under index 3001h. To this end, the entry 1800h/02h (transmission type) must contain the value 254 (asynchronous, manufacturer-specific).

### 10.6 Service Data: SDO

The parameters, listed in the object dictionary, are read and written through Service Data Objects (SDOs). As shown in Table 19, every object can directly be addressed over a 16-bit index. In addition, each index has an 8-bit subindex that allows an additional choice within an index. The 8 bytes of the SDOs are placed in the data area of the CAN message.

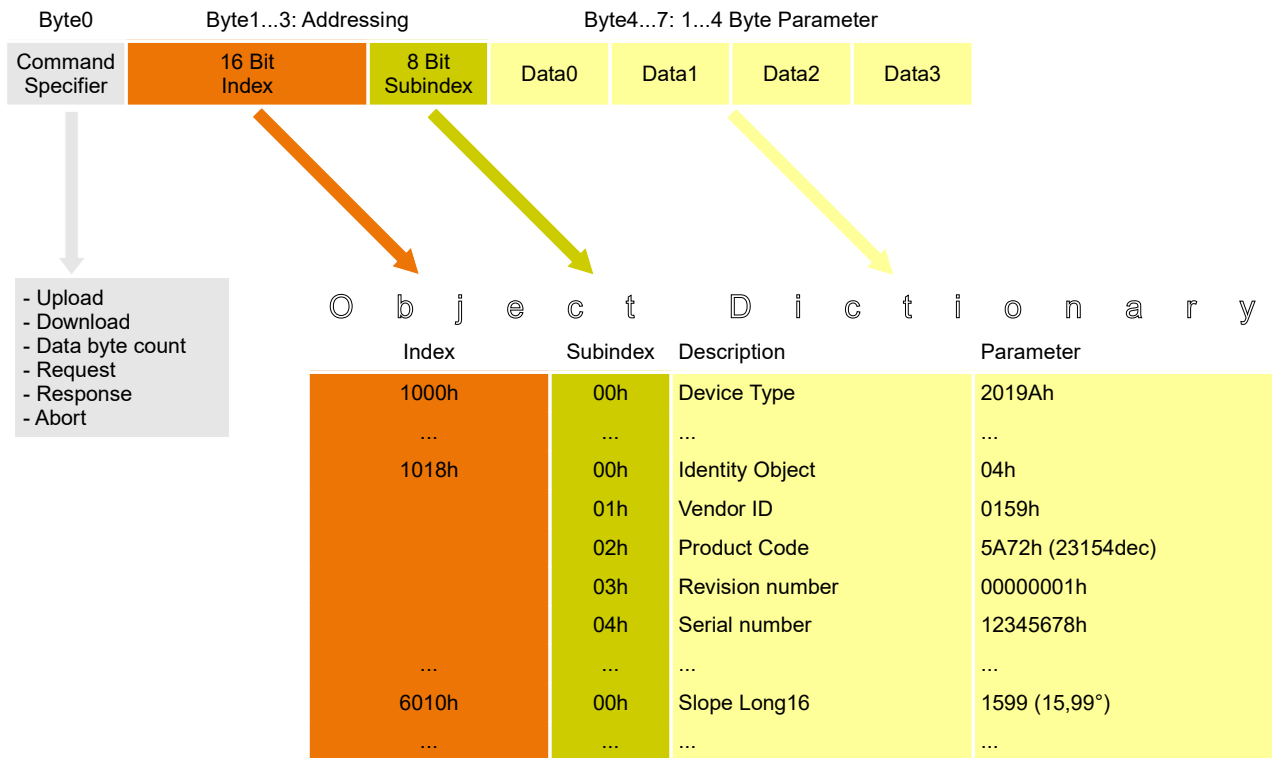

Figure 18: SDO Protocol – Access to Object Dictionary

### 10.7 Object Dictionary

The object directory contains all data objects that are accessible from the outside and affect the behavior of communication, application and status machines. It is divided into three parts:

- Communication specific Part (Index: 0x1000 – 0x1FFF)
- Manufacturer specific Part (Index: 0x2000 – 0x5FFF)
- Profile specific Part (Index: 0x6000 – 0x9FFF)

All parameters in the object dictionary can be read and written using the standard SDO via index and sub-index.

The following sections describe all the parameters in the object dictionary of the inclination sensor with index, subindex, data type, access rights and default (factory setting). The column "Save" indicates whether a parameter in the internal volatile memory ("save" signature in OD-Write Index 1010h/01h) can be saved.

### 10.7.1 Communication Parameters (according to CiA DS-301)

Index	Sub-Index	Parameter	Data Type	Access	Default Value	Save
1000h	0	Device Type (Device profile 410), Type IS1xx360-O-x(-10) / IS2xx090-O-xx(-10)	UNS32	const	1019Ah/2019Ah	
1001h	0	Error Register	UNS8	ro	0

**Table 19: Communication Parameters in the Object Dictionary**

#### 10.7.1.1 Error Register (1001h)

The error register displays the general error state of the device. Each bit stands for an error group. If one bit is set (= 1), at least one error of that specific group occurred. The content of this register is transmitted in each EMCY object. The following error groups may occur:

Error Register (1001h)							
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Manufacturer Specific Error	Accuracy Warning	Profile Specific Error	Communication Error	Unused			At least one active fault

**Table 20: Error Register (1001h)**

If the device is in error state (at least one active error) this is shown by the set Bit0 (= 1). In case of a communication error (overflow of the transmit / receive buffers, guarding errors or CAN controller in passive mode / Bus-Off) the Bit4 is set. A device profile specific error (sensor error) is shown by Bit5. The Bit7 indicates a vendor-specific error (EEPROM error). The bit "Accuracy Warning" is reset only, when the constant temperature for temperature compensation of the sensors ISxTKxxx-O-RL is reached. Only in this case the accuracy values from the technical specification in table 1 are valid.

#### 10.7.1.2 Manufacturer Status Register (1002h)

This Register shows the recent state of all detectable errors. Here each bit represents a specific error. If a bit is set (= 1), this error is active at that moment. The lower 16 bits of this register (Bit15...Bit0) are transmitted in the first two bytes of the manufacturer specific part of each EMCY object and are also registered in

the additional information field (Bit31-Bit16) of the Pre-defined Error Field 1003h. The definitions of the individual bits in the bit fields "Device Error" and "Communication Error" are shown in Table 31.

Manufacturer Status Register (1002h)		
Bit31...Bit16	Bit15...Bit8	Bit7...Bit0
Unused	Bit field Communication Error	Bit field Device Error

**Table 21: Manufacturer Status Register (1002h)**

#### 10.7.1.3 Pre-defined Error Field (1003h)

Each inclination sensor has an error list holding the last five errors. The entry 1003h/00h contains the number of error entries in the error field. The other subindices contain all occurred error states in chronological order. The last error occurred is always located at SubIndex 01h. The oldest error can be found in the largest available SubIndex (value of 1003h/00h) and will be the first to be deleted from the list with occurrence of more than five errors. If a new error occurs a new error entry is added in 1003h and the master is notified by an EMCY object. An error entry is structured as follows:

Error Entry in Pre-defined Error Field (1003h)		
Additional Information Field (Bit31...Bit16)		Error Code (Bit15...Bit0)
Bit15...Bit0 of the manufacturer status register 1002h (at the moment of error occurrence)		0x0000 Error reset or no error present
		0x5010 Sensor Error / Sensor Error X
		0x5020 Sensor Error Y
		0x8110 Overflow of the transmit / receive buffers
		0x8120 CAN Warning Limit reached
Bit field Communication error	Bit field Device Error	0x8130 Node Guard Event
		0x8140 Recovered from Bus-Off

**Table 22: Error Entry in Pre-defined Error Field (1003h)**

The error list can be reset completely by writing 0 to entry 1003h/00h.

#### 10.7.1.4 Saving (1010h) and Loading (1011h) of Parameters

If parameters are changed in the object dictionary those changes will take effect immediately. To ensure the changed parameters are still active after Reset they have to be saved in the internal EEPROM. By writing the signature „save“ (65766173h) to the entry 1010h/01h all the current parameters of the object dictionary will be saved in the internal permanent memory.

The object dictionary can be reset to its default settings by writing the signature „load“ (64616F6Ch) into the entry 1011h/01h. By doing this the factory parameters are written in the permanent memory. After a „Reset Application“ (NMT command) or a hardware reset the changes will take effect (a „Reset Communication“ (NMT command) effects the communication parameters only).

By writing the signature on SubIndex: 02h, 03h or 04h, it is possible to store or load only parts of the object directory.

### 10.7.1.5 Transmit PDO1 – Transmission Type (1800h)

The entry 1800h/02h can be used to define how the transmission of the PDO is triggered.

Transmit PDO1 - Transmission Type (1800h/02h)	
Transmission Type	Description
1...240	Synchronous (cyclic) Transmission after each 1...240 reception of a SYNC message only „Synchronized Transmission“ via SYNC possible
253	Transmission with RTR only
254	Asynchronous, manufacturer-specific „Cyclic Transmission“ and/or „Transmission on Inclination Change“ activated by appropriate configuration

**Table 23: Transmit PDO1 - Transmission Type (1800h/02h)**

### 10.7.2 Manufacturer Specific Part

Index	SubIndex	Parameter	Data type	Access	Default value	Save
2002h	0	Automatic Bus-Off Recovery	BOOL	rw	0	x
3000h	Digital Filter Settings					
	0	Largest supported SubIndex	UNS16	ro	2	
	1	Filter type (0=off, 1=Butterworth, 2=critical damped)	UNS16	rw	2	x
	2	Cut-off frequency digital filter	UNS16	rw	2000	x
3001h	TPDO1 Transmission on Inclination Change, Type IS1xx360-O-xL(-10)					
	0	Largest supported SubIndex	UNS16	ro	2	
	1	Enable/Disable (1/0) transmission on inclination change	UNS16	rw	0	x
	2	Minimum inclination change for axial axis (multiple of °/100)	UNS16	rw	100	x
3001h	TPDO1 Transmission on Inclination Change, Type IS2xx090-O-xL(-10)					
	0	Largest supported SubIndex	UNS16	ro	3	
	1	Enable/Disable (1/0) transmission on inclination change	UNS16	rw	0	x
	2	Minimum inclination change for longitudinal (X) axis (multiple of °/100)	UNS16	rw	100	x
	3	Minimum inclination change for lateral (Y) axis (multiple of °/100)	UNS16	rw	100	x
5555h	Reserved index (access for manufacturer only)					

**Table 24: Manufacturer Specific Part of the Object Dictionary**

#### 10.7.2.1 Automatic Bus-Off Recovery (2002h)

This property determines the behavior of the inclination sensor when it is in the state Bus-Off. If enabled, the sensor, which is in Bus-Off state may become error-active (no longer Bus-Off) with its error counters both set to zero after having monitored 128 occurrences of 11 consecutive recessive bits on the bus.

If disabled, the inclination sensor remains in Bus-Off state.

#### 10.7.2.2 Digital Filter Settings (3000h)

The inclination sensor offers the possibility to suppress the influence of external disturbing vibrations. The internal lowpass digital filters (8th order) are programmable down to 0.1 Hz. The sensor has two digital filters that can be selected according to the application of the sensor.

Filter	Adjustable frequency range	Applications
Butterworth	0,1 Hz ... 25 Hz	Static inclination measurement with high damping to vibration
Critically damped	0,1 Hz ... 8 Hz	Inclination measurement in applications that requires a certain dynamism, without overshoot at angle changes with good damping

**Table 25: Filter selection**

Through the entry 3000h/02h the filter type will be selected. The cut-off frequency is programmable through the object 3000h/02. Values for the cut-off frequency are allowed between 100 (= 0.1 Hz) and 25000/8000 (= 25 Hz/8 Hz).

**Figure 19: Impulse and amplitude response of the two filters**

### 10.7.2.3 TPDO1 Transmission on Inclination Change (3001h)

Through the entry 3001h/01h the event controlled transmission of the TPDO1 on inclination change can be enabled (= 1) or disabled (= 0). For the activation the transmission type of TPDO1 must be set to “Asynchronous, manufacturer-specific” (1800h/02h = 254).

SubIndices 02h and 03h offer the separated setting of the minimum necessary inclination change for the longitudinal (X) and lateral (Y) axis. These two angle values are mentioned in °/100 (100fold angle value) and can be set freely from 1 = 0.01° to maximum.

If this function is enabled the inclination sensor outputs the TPDO1 object in the state OPERATIONAL in case of inclination changes of the longitudinal and/or the lateral axis greater than set under 3001h/02h and 03h. During operation the angle difference between the recent inclination value and the last one sent by the TPDO1 is permanently calculated and checked. With each change to the state OPERATIONAL the inclination sensor posts the recent position by the TPDO1 object, too (only if 3001h/01h = 1).

**Remarks:**

If small inclination differences are set under 3001h/02h and 03h it is recommended to enable the digital filter (index 3000h) to reduce the influence of vibrations and the frequent output of the TPDO1.

### 10.7.3 Device Profile Specific Part (according to CiA DS-410)

Index	Sub-Index	Parameter	Data type	Access	Default value	Save
6000h	0	Resolution (multiple of 0,001°)	UNS16	ro	10	
6010h	0	Inclination value longitudinal (X-axis, 100fold angle value in °)	INT16	ro	-	
6011h	0	Operating Parameter longitudinal (Inversion, Zero Point Adjustment)	UNS8	rw	0	x
6012h	0	Preset Value longitudinal (X) Axis	INT16	rw	0	x
6013h	0	Offset Value longitudinal (X) Axis	INT16	rw	0	x
6014h	0	Differential Offset Value longitudinal (X) Axis	INT16	rw	0	x
6020h	0	Inclination value lateral (X-axis, 100fold angle value in °)	INT16	ro	-	
6021h	0	Operating Parameter lateral (Inversion, Zero Point Adjustment)	UNS8	rw	0	x
6022h	0	Preset Value longitudinal (Y) Axis	INT16	rw	0	x
6023h	0	Offset Value longitudinal (Y) Axis	INT16	rw	0	x
6024h	0	Differential Offset Value longitudinal (Y) Axis	INT16	rw	0	x

**Table 26: Device Profile Specific Part of the Object Dictionary**

#### 10.7.3.1 Resolution (6000h)

The resolution of all inclination sensors is constantly set to 0.01° (default: 10 \* 0.001°). All angle values in the object dictionary (6010h, 6012h, 6013h, 6014h and 6020h, 6022h, 6023h, 6024h) are to be interpreted as a multiple of 0.01°.

#### Example:

Inclination value = -2370 x 0.01° → -23.70°

#### 10.7.3.2 Inclination values longitudinal and lateral (6010h and 6020h)

The recent inclination values of the inclination axis are accessible by SDO access to the object dictionary (in each device state) as well as by TPDO. If Zero Point Adjustment is enabled via the operating parameters 6011h and 6021h, the inclination value is calculated as follows:

$$\text{Inclination Value} = \text{Physically Measured Inclination Value} + \text{Diff. Offset Value} + \text{Offset Value}$$

On disabled Zero Point Adjustment:

$$\text{Inclination Value} = \text{Physically Measured Inclination Value}$$

#### Example:

Value Range Type IS1xx360-O-xL(-10): -18000 ... +17999 → -180,00° ... +179,99° = 0 ...359,99°

Value Range Type IS2xx090-O-xL(-10): -9000 ... +9000 → - 90,00° ... + 90,00°

#### 10.7.3.3 Operating Parameters (6011h and 6021h)

The operating parameters settings of an inclination sensor (6011h and 6021h) allow the changing of the mathematical sign of the inclination value and a Zero Point Adjustment. On Factory Default Settings, these options are disabled, i.e. the direction of the inclination value (polarity of the axis) corresponds to the one shown on the nameplate of the inclination sensor.

Operating Parameters (6011h and 6021h)							
Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
Unused						Zero Point Adjustment 0 = /inactive 1 = active	Inversion 0 = /inactive 1 = active

**Table 27: Operating Parameters (6011h and 6021h)**

#### 10.7.3.4 Zero Point Adjustment: Preset Value, Offset Value, Differential Offset Value (60x1/2/3h)

Using the values “Preset Value”, “Offset Value” and “Differential Offset Value” the adjustment of the Zero Point is possible. The Zero Point Adjustment is only active if the Bit1 in the operating parameters (6011h/6021h) is set.

Value	Object	Description
Preset Value	6012h 6022h	Preset Value for Zero Point Adjustment, value range depends on settings in object 6000h
Offset Value	6013h 6023h	Calculated Offset Value when writing to object 6012h or 6021 Calculated Offset Value = Preset Value at tacc – physically measured Inclination Value at tacc – Differential Offset Value tacc: time when accessing object (6012h,6022h)
Differential Offset Value	6014h 6024h	Additional Offset, regardless of object 6012h and 6013h / 6022h and 6023h The value you enter here will be added up directly to the inclination value.

**Table 28: Zero Point Adjustment**

## 10.8 Emergency Objects

Each inclination sensor supports EMCY objects which are transmitted in case of sensor and hardware errors. If such an error occurs the OD entries 1001h (Error Register), 1002h (Manufacturer Status Register) and 1003h (Pre-defined Error Field) are updated. After abolishment of an error, the device transmits an emergency message with the Error Reset Code 0x0000. Remaining errors are signaled in Byte2 (Error Register) and Bytes 3,4 in the Manufacturer specific error field. Once the device is error-free, it sends an emergency message which contains only zeros. The current state of the device (Pre-Operational, Operational or Stopped) is not influenced by the error states, except in case of a guarding error.

Emergency messages are sent with high priority on the bus and are always 8 bytes long. The structure of the telegram is shown in Table 29:

Emergency Object							
Byte0	Byte1	Byte2	Byte3	Byte4	Byte5	Byte6	Byte7
Emergency Error Code		Error Register (1001h)	Manufacturer Specific Error Field				
			Bit field Communication Error	Bit field Device Error	0x00	0x00	0x00

**Table 29: Emergency Object**

Emergency Error Codes	
0x0000	Error Reset or no Error (Error Register = 0)
0x5010	Sensor Error / Sensor Error X, Inclination value out of range
0x5020	Sensor Error Y, Inclination value out of range
0x8110	Overflow of the transmit / receive buffers, CAN messages were lost
0x8120	CAN Warning Limit reached
0x8130	Node Guard Event (The loss of the Guarding-Master has been detected)
0x8140	Recovered from Bus-Off

**Table 30: Emergency Error Codes**

Bit field Device Errors		
0x01	Sensor Error	type only: IS1xx360-O-xL(-10)
0x01	Sensor Error X-Axis	type only: IS2xx090-O-xL(-10)
0x02	Sensor Error Y- Axis	type only: IS2xx090-O-xL(-10)
0x80	EEPROM Error: An error occurred while saving the configuration.	
Bit field Communication Errors		
0x01	CAN Warning Limit reached (too many Error Frames)	
0x02	CAN Bus-Off State reached (An Emergency message will be transmitted after the device has recovered from Bus-Off)	
0x04	Receive Queue Overrun,	CAN messages were lost
0x08	Transmit Queue Overrun,	CAN messages were lost
0x80	Guarding Error,	The loss of the Guarding-Master has been detected. (Node Guard Event)

**Table 31: Emergency: Manufacturer Specific Error Field**

## 10.9 Failure monitoring

Since the nodes do not respond at regular intervals with the event-controlled transmission in a CANopen network, Heartbeat and Nodeguarding / Lifeguarding failure monitoring mechanisms are provided. Only one of the two monitoring methods can be active.

### 10.9.1 Nodeguarding / Lifeguarding

Nodeguarding is the monitoring of one or several nodes by the NMT master. The NMT master periodically sends a RTR message frame to the slave to be monitored, which responds with its status and a toggle bit. If the status or the toggle bit do not comply with the status or toggle bit expected by the guarding master or if no response is provided, the master assumes a slave error.

The node to be monitored may also use this mechanism to detect a failure of the guarding master. Therefore two parameters are used. The interval time after which the guarding master polls the inclination sensor to be monitored is the Guard Time (100Ch). Another parameter, the Life Time Factor (100Dh), defines a multiplier after which the connection is deemed to be interrupted. This time is designated as the node life time.

$$\text{„Node Life Time“} = \text{„Guard Time“} \times \text{„Life Time Factor“}$$

If the inclination sensor does not receive a guarding request from the master within the parametrized time, it also assumes a master failure, sends an emergency message frame and returns to the "Pre-Operational" state. If either of the two parameters is "0" (default setting), the master is not monitored (no Lifeguarding).

### 10.9.2 Heartbeat

Heartbeat is a failure monitoring mechanism which can operate without using RTR message frames. In this case, the inclination sensor cyclically transmits a heartbeat message which contains the state of the device. The master can monitor these message frames. Heartbeat is activated once a value greater than "0" is entered in the heartbeat interval time register (1017h).

#### Remarks:

Heartbeat has a significant influence on the bus load of the CANopen network, but produces only half the bus load of Nodeguarding / Lifeguarding.

## 10.10 LSS: Layer Setting Service (according to CiA DSP-305)

### 10.10.1 Setting of Node-ID and Baud Rate

The setting of the node address (Node-ID) and the Baud Rate is realized by LSS (Layer Setting Service). For communication between LSS Master and LSS Slave (inclination sensor) two CAN identifiers (7E5h and 7E4h) are used. Each inclination sensor has a unique 128-bit LSS address, at which it can be addressed in the CAN network. This address is composed of the three 32-bit parameters of the Identity object 1018h and the serial number:

Vendor-ID	0000 0159h	(Manufacturer ID: GEMAC Chemnitz GmbH)
Product Code	0000 5A72h	(5A72h = 23154dec = PR-23154-30)
Revision Number	0000 001Eh	(1Eh = 30dec = PR-23154-30)
Serial Number	xxxx xxxxh	(respective serial number of the incl. sensor → nameplate)

The default values for Node-ID and Baud Rate at delivery (factory settings) are:

Node-ID	10
Baud Rate	Automatic Baud Rate Detection

Index	Baud Rate
0	1 MBit/s
1	800 kBit/s
2	500 kBit/s
3	250 kBit/s
4	125 kBit/s
5	unused
6	50 kBit/s
7	20 kBit/s
8	10 kBit/s
9	Automatic Baud Rate Detection

**Table 32: LSS Baud Rate Index according to CiA DSP-305**

## 10.11 Automatic Baud Rate Detection (according to CiA AN-801)

The automatic baud rate detection is used to automatically adjust the baud rate of the inclination sensor on the existing baud rate in the network. After power-on the inclination sensor only listens to the CAN network without acknowledging the received messages on the bus. This operating condition is characterized by the flickering RUN-LED (see also chapter: 10.13, „Status LED (according to CiA DR-303-3)“). The sensor checks all the available baud rates. Upon reception of a valid CAN telegram, the correct baud rate is adjusted. Then the sensor starts up, sends its boot-up message and enters the Pre-Operational state. (see also Figure 17).

### Remarks:

For proper operation of the automatic baud rate detection it is necessary to receive messages from other can nodes on the bus.

### 10.12 Active compensation of thermal accuracy shift

The inclination sensors of ReferenceLine (ISxTKxxx-O-RL) features, in contrast to the other sensors, an active compensation of the thermal accuracy shift. This improvement is done by maintaining the sensor element at a constant temperature which is independent of the operation temperature of the inclination sensor.

### 10.13 Status LED (according to CiA DR-303-3)

The integrated two-color Status LED signals the recent device state (Run LED, green) as well as CAN communication errors that might have occurred (Error LED, red). The color and the flashing frequency of the LED distinguish the different device states as shown in table 33.

Status LED		
RUN LED	LED State	Description
 ...	Off	The device is in state Reset or no power supply is connected
 ...	Flickering	Automatic baud rate detection is currently running (active)
 ...	Blinking	The device is in state Pre-Operational
 ...	Single Flash	The device is in state Stopped
 ...	On	The device is in state Operational
ERROR LED	LED State	Description
 ...	Off	The device is in working condition
 ...	Single Flash	CAN Warning Limit reached
 ...	Double Flash	The loss of the Guarding-Master has been detected. (Node Guard Event)
 ...	On	The device is in state Bus-Off

Legend:  LED off     LED on     LED flickering (50 ms on/off)    Duration of /: 200 ms

**Table 33: Status and Error Display of the Two-Color LED**

## 11 Sensor configuration

### 11.1 Inclination sensor programming adapter

With the optional inclination sensor programming adapter (starter kit ISPA1 - PR-23999-02) it is possible to adjust all inclination sensors with CAN/CANopen, current or voltage interface. The programming adapter is connected via USB to a PC. The connection of the sensors with the programming adapter is realized through various included adapter cables. The inclination sensor is supplied with power through the adapter. Except for the ISxTKxxx-C-RL there is no additional power supply necessary.

Figure 20: Starter kit

## 11.2 PC software ISDControl

The parametrization of all possible values is done with the PC software ISDControl, which is included in all starter kits. Each configuration can be stored in a file.

Properties:

- comfortable configuration of all parameters of the inclination sensor
- 3D imaging and display of the current angle
- Oscilloscope display of the current angle
- Firmware Download option
- Automatic inclination sensor search for unknown communication parameters
